ROLL NO: 240701487

LAB EXERCISE 07

USER, ROLE AND PERMISSION MANAGEMENT IN ZOHO CREATOR FOR HOSPITAL MANAGEMENT SYSTEM

Aim

To set up user roles and permission profiles for the Hospital Management System in Zoho Creator and demonstrate how access, viewing and editing rights can be allocated according to application responsibilities.

Procedure

1. Open the existing Hospital Management System in Zoho Creator and check that the dashboard and reports are available.

2. Go to Settings, then Users and Permissions, and open the Permissions area.

3. Prepare permission profiles for the hospital forms, including Admission, Appointment, Billing, Patient, Prescription, Medicine and Room.

4. Open the Roles section and define the reporting hierarchy for the application.

5. Create the Admin, Doctor, Nurse/Staff, Receptionist, Pharmacist and Patient roles, assigning the reporting relationships shown in the exercise.

6. Connect the relevant permission profiles to the roles and limit access to modules that are not needed by a role.

7. Save the configuration and review the resulting access settings for each role.

Overview

The practical combines two parts of user administration: defining the reporting hierarchy and creating permission profiles. The roles shown include Admin, Doctor, Nurse/Staff, Receptionist, Pharmacist and Patient. Permission settings are then applied to hospital modules so that users can work with the records relevant to their duties.

Output / Screenshots

The following figures reproduce the application screenshots supplied in the reference practical. They are included as source illustrations and have not been edited to change the account identity displayed within them.

1. Admin Role Details and Access

The Admin role is positioned at the top of the application hierarchy. It is intended for a user responsible for overall administration and therefore has broad access to hospital data and management features.

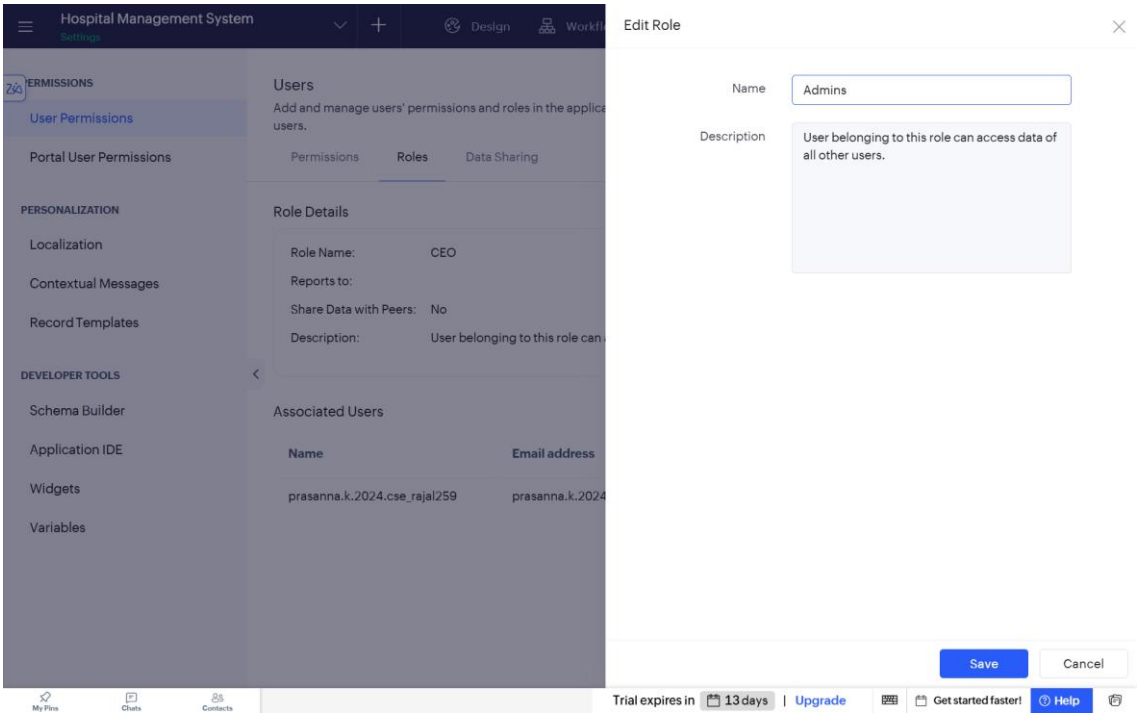

Figure 1: Admin Role Details and Access

2. Creating the Doctor Role

The Doctor role is added beneath Admin. It represents medical users who need access to patient-related and clinical information required for their work.

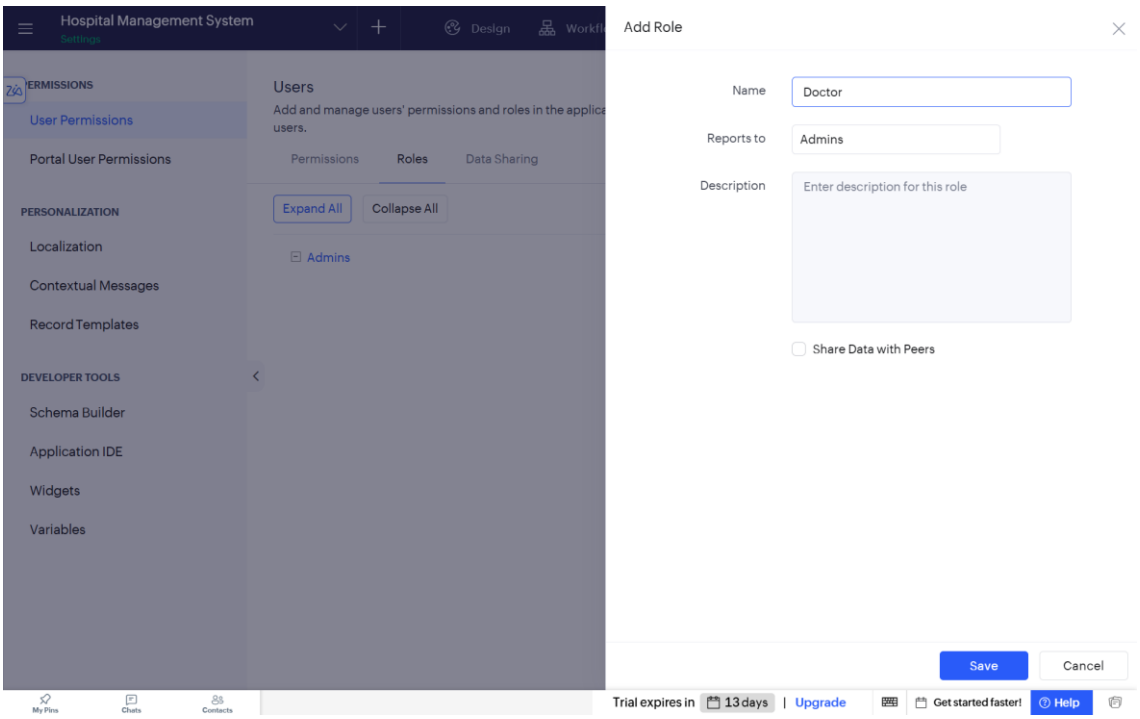

Figure 2: Creating the Doctor Role

3. Creating the Receptionist Role

The Receptionist role is placed under Admin and supports front-office tasks, including appointment coordination, admission handling and billing activities.

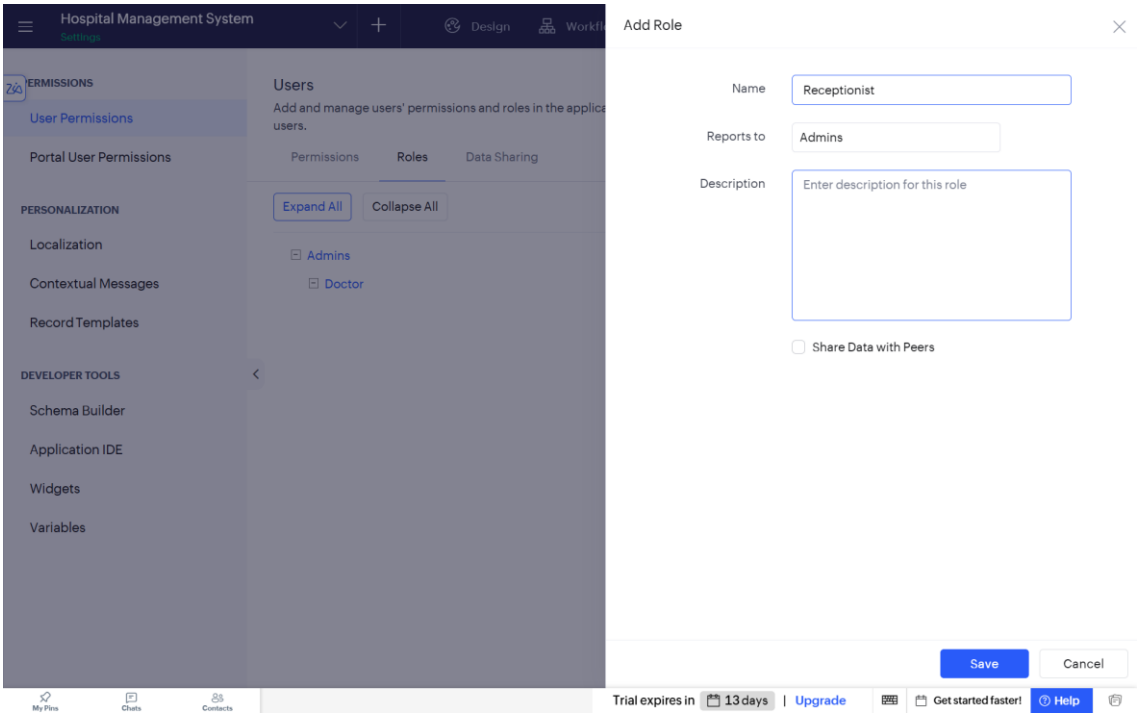

Figure 3: Creating the Receptionist Role

4. Creating the Pharmacist Role

The Pharmacist role is associated with the Admin level and is intended for medicine and prescription-related responsibilities.

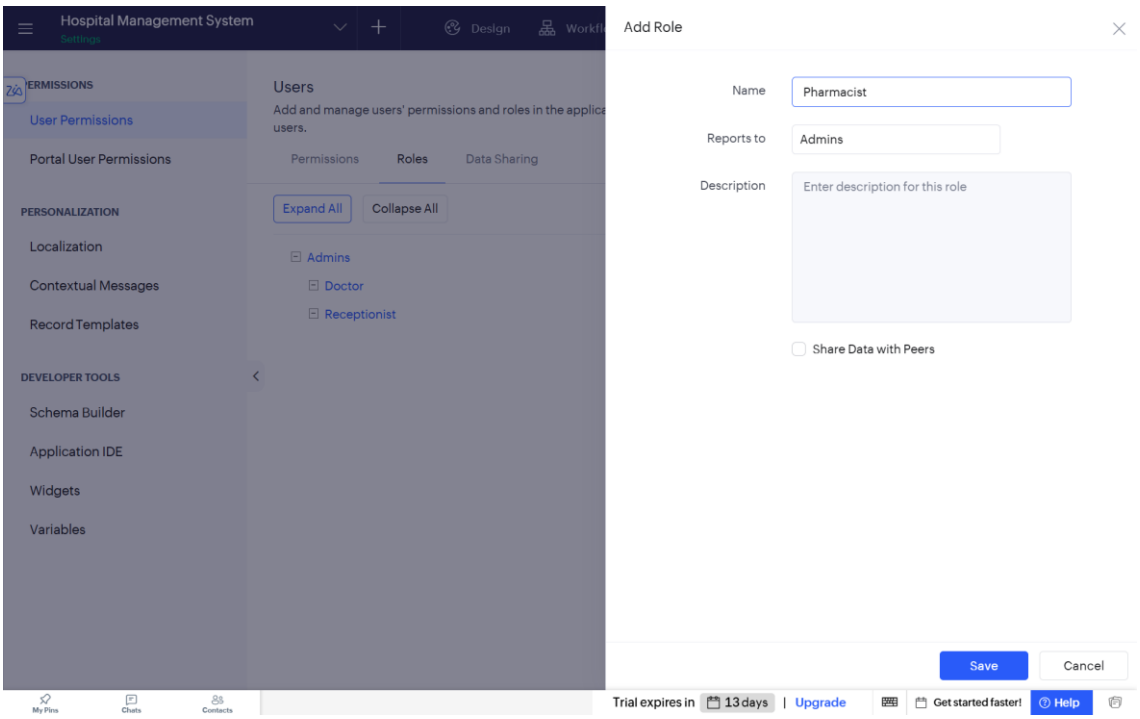

Figure 4: Creating the Pharmacist Role

5. Creating the Nurse / Staff Role

The Nurse/Staff role is configured to report to the Doctor role, reflecting the reporting relationship shown in the application hierarchy.

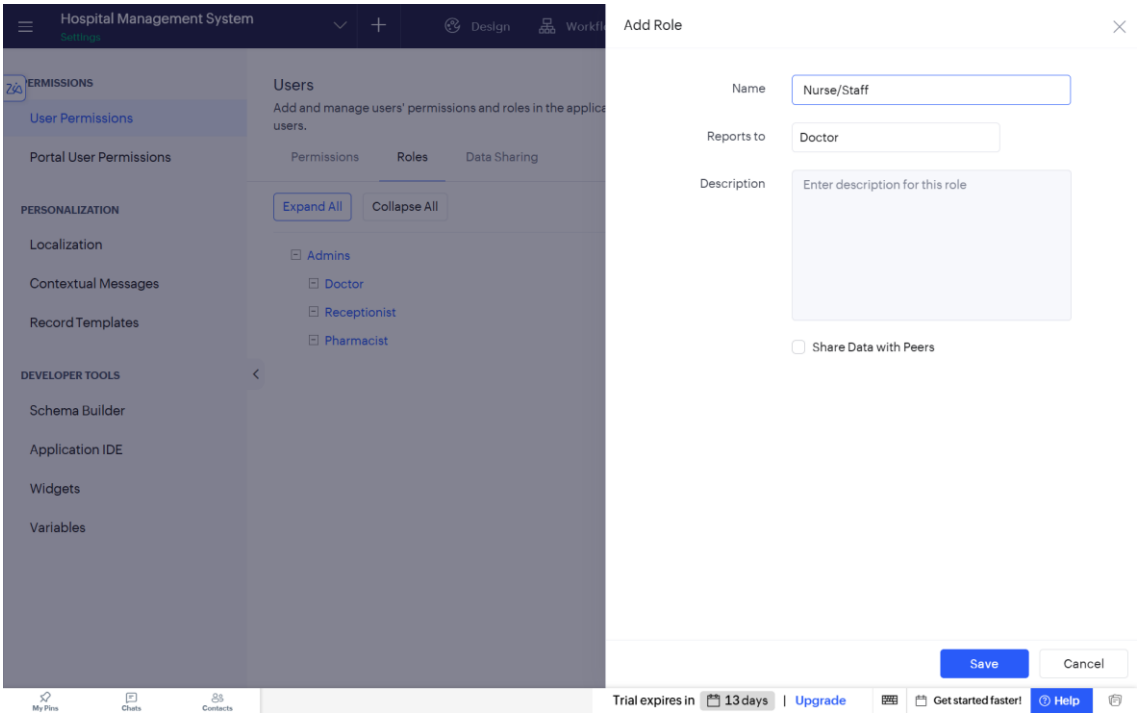

Figure 5: Creating the Nurse / Staff Role

6. Creating the Patient Role

The Patient role is configured with Receptionist as its reporting role, following the hierarchy demonstrated in the supplied exercise.

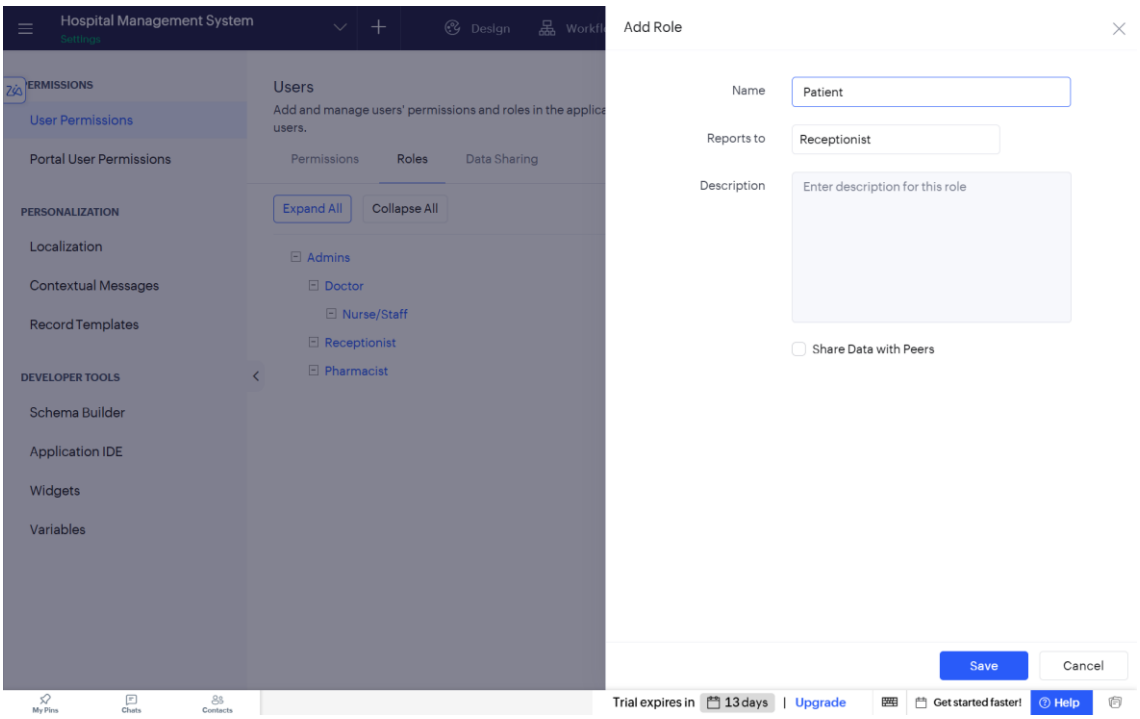

Figure 6: Creating the Patient Role

7. Role Hierarchy View

The Roles page displays the reporting structure for the hospital application. It provides an overview of how the roles are arranged and related to one another.

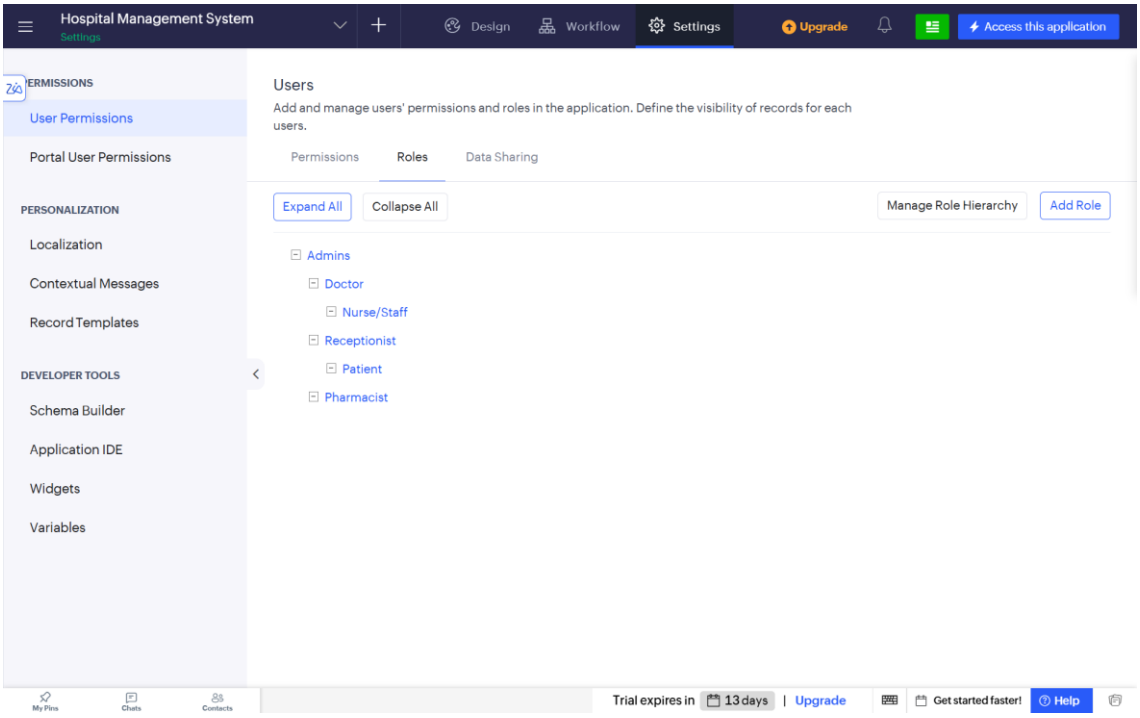

Figure 7: Role Hierarchy View

8. Permission Profile Details

A permission profile contains a description and module-specific access settings. These profiles are prepared so that suitable permissions can be associated with each application role.

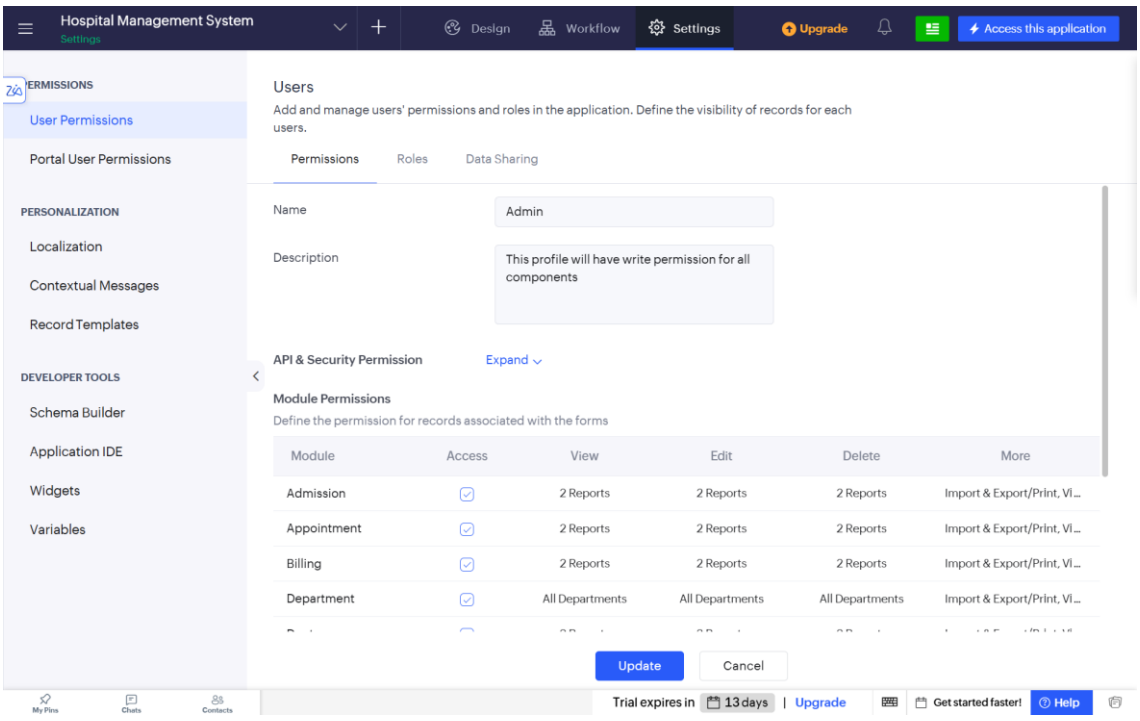

Figure 8: Permission Profile Details

9. Configuring Admission, Appointment and Patient Access

The permission settings shown here demonstrate how access to Admission, Appointment and Patient modules can be selected according to the responsibilities of a user group.

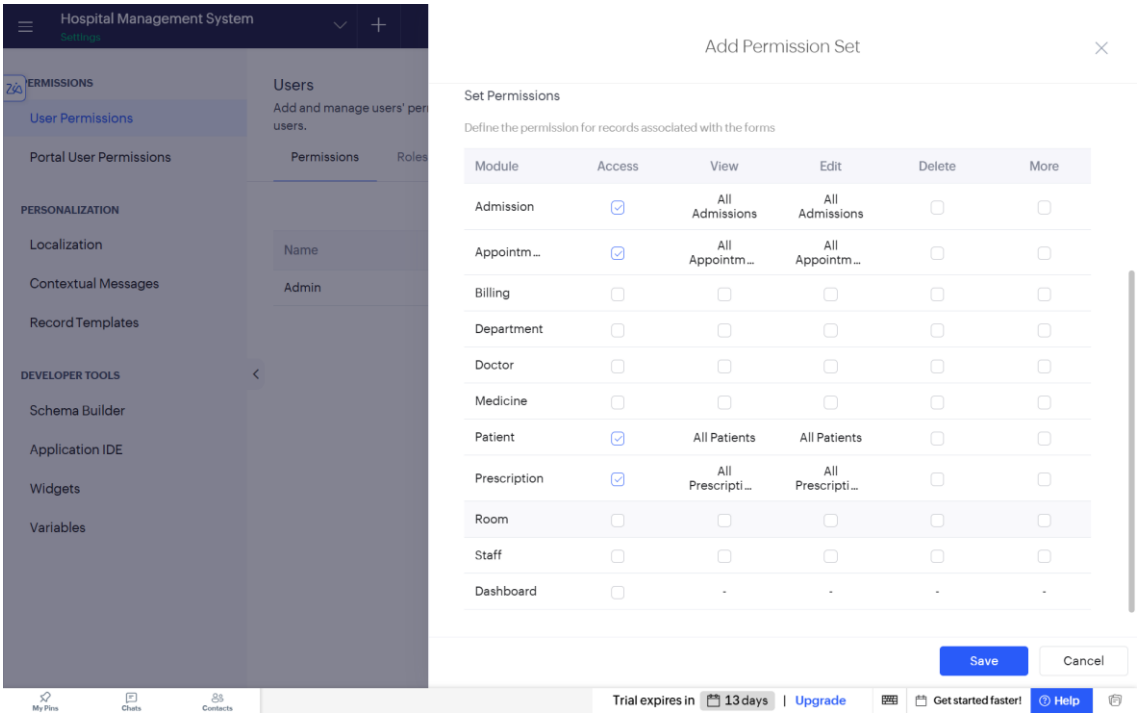

Figure 9: Configuring Admission, Appointment and Patient Access

10. Configuring Appointment and Patient Access

Appointment and Patient modules are assigned the required access and editing capabilities, while unrelated modules can remain unavailable to that role.

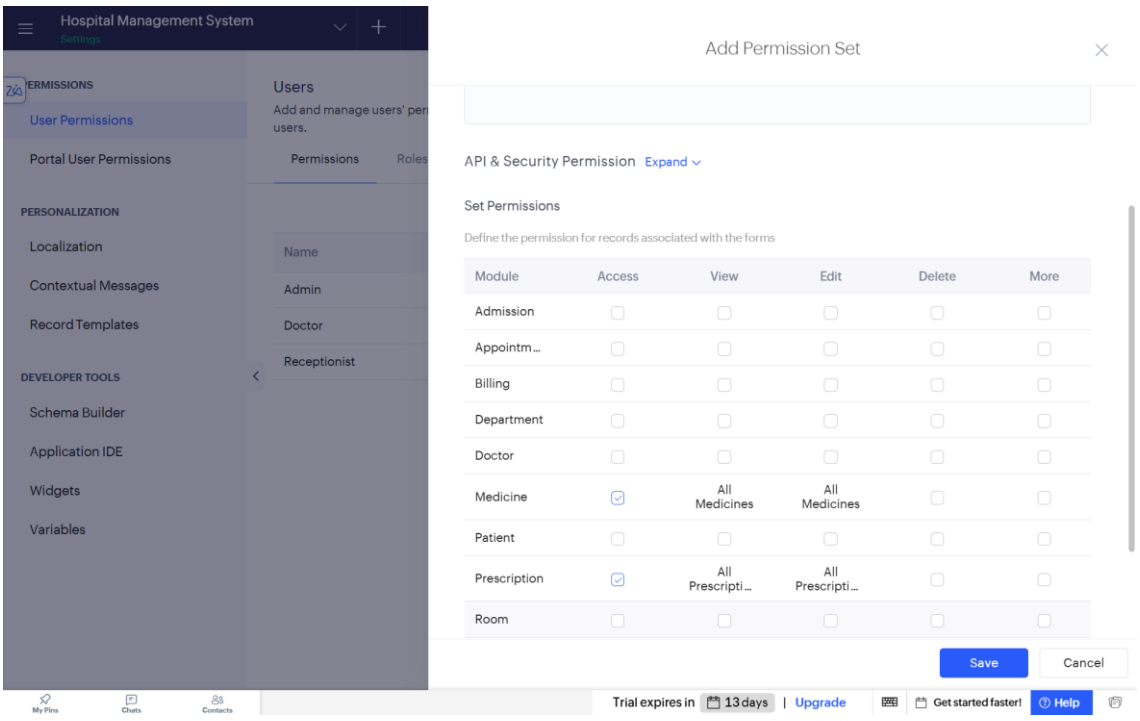

Figure 10: Configuring Appointment and Patient Access

11. Configuring Medicine and Prescription Access

Medicine and Prescription permissions are configured for the users who need to work with medication and prescription information.

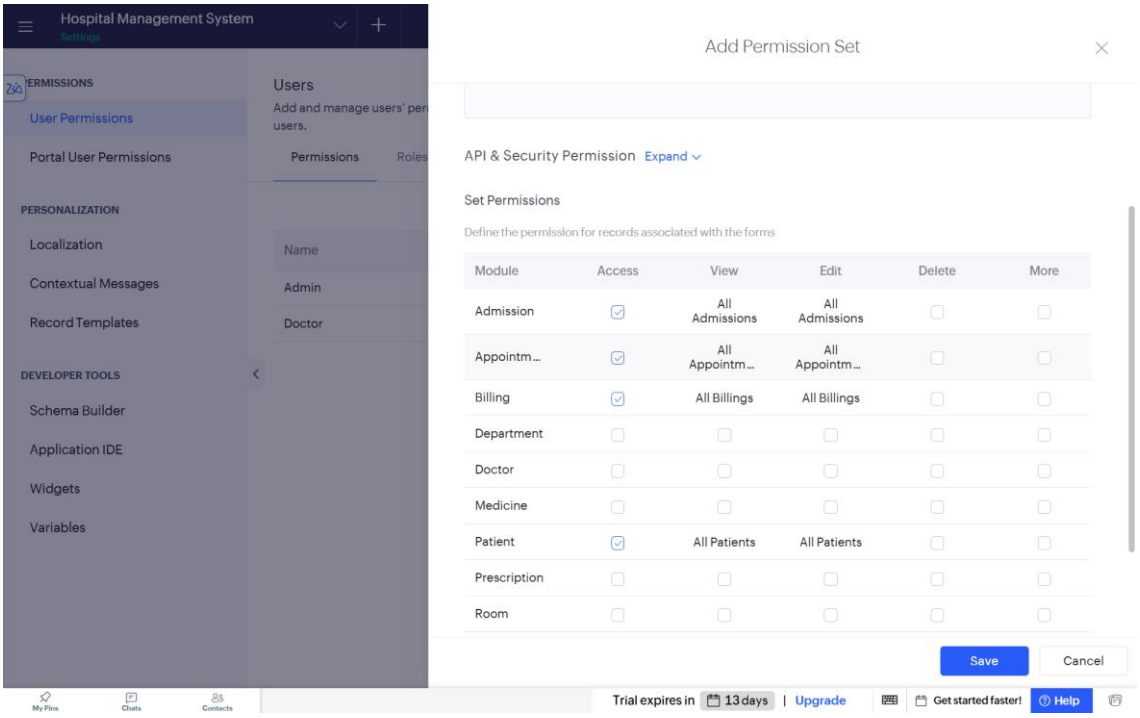

Figure 11: Configuring Medicine and Prescription Access

12. Configuring Additional Module Permissions

The permission setup is extended across other hospital modules. The intention is to grant only the access needed for the tasks assigned to each role.

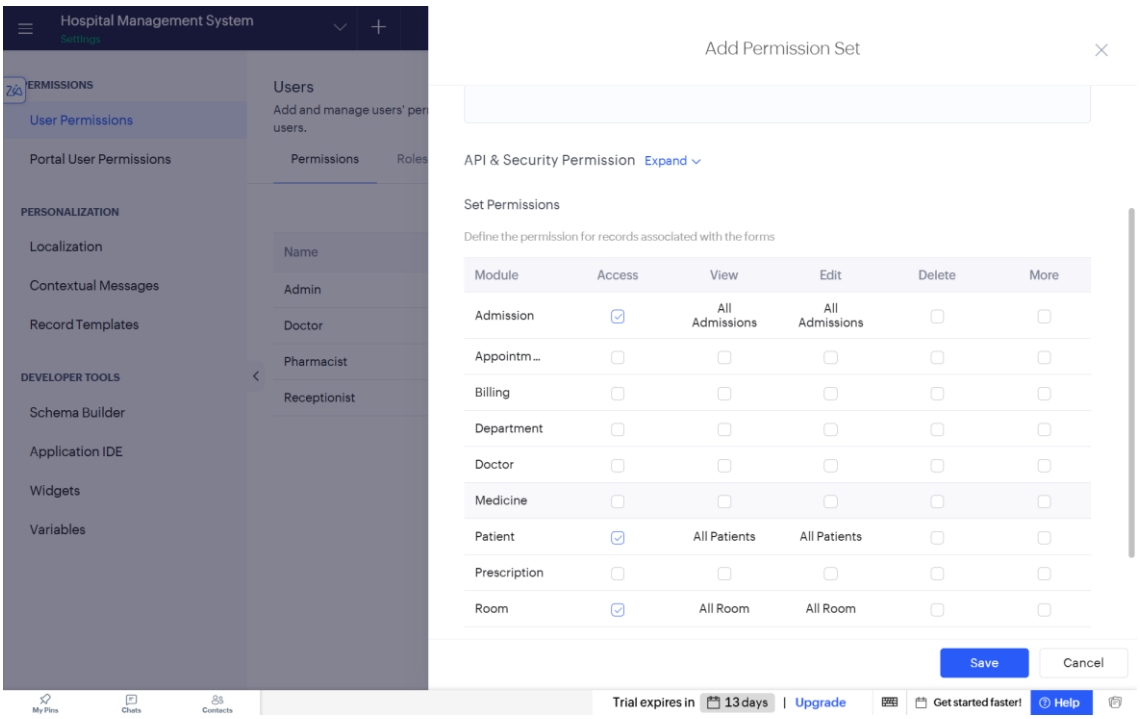

Figure 12: Configuring Additional Module Permissions

13. Module-Level Permission Configuration

Module-level settings define which parts of the application a role can access and which actions are permitted for each selected module.

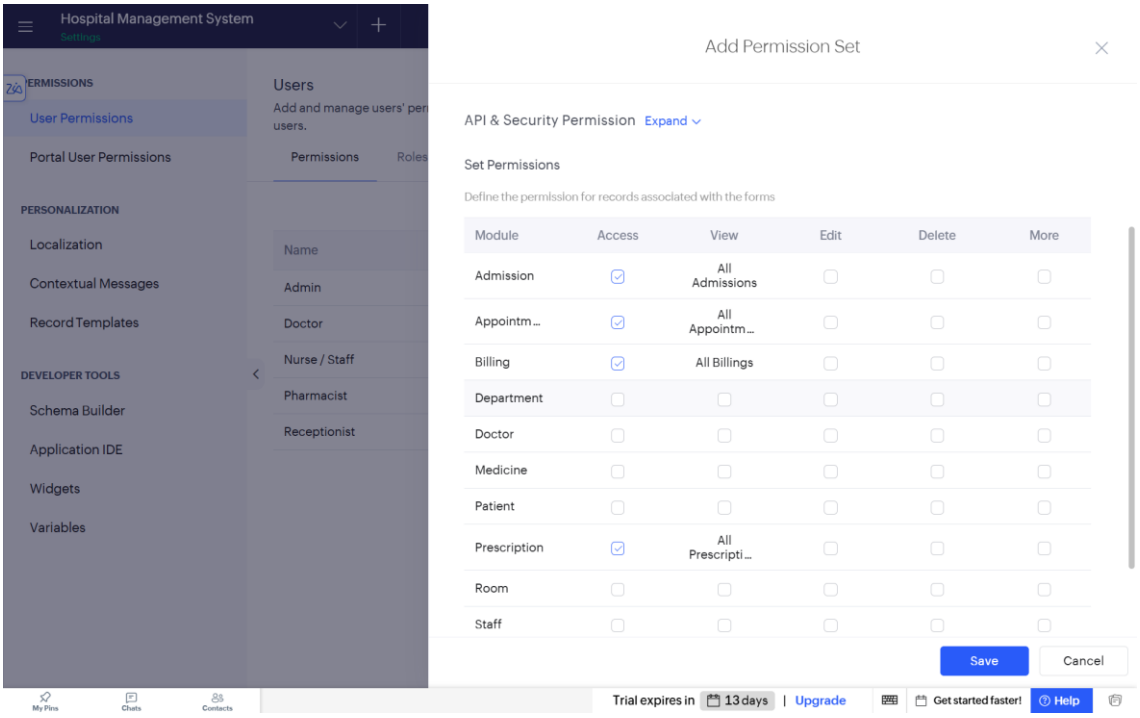

Figure 13: Module-Level Permission Configuration

14. Permission Profiles List

The User Permissions area lists the profiles created for the application, including separate profiles for Admin, Doctor, Nurse/Staff, Patient, Pharmacist and Receptionist.

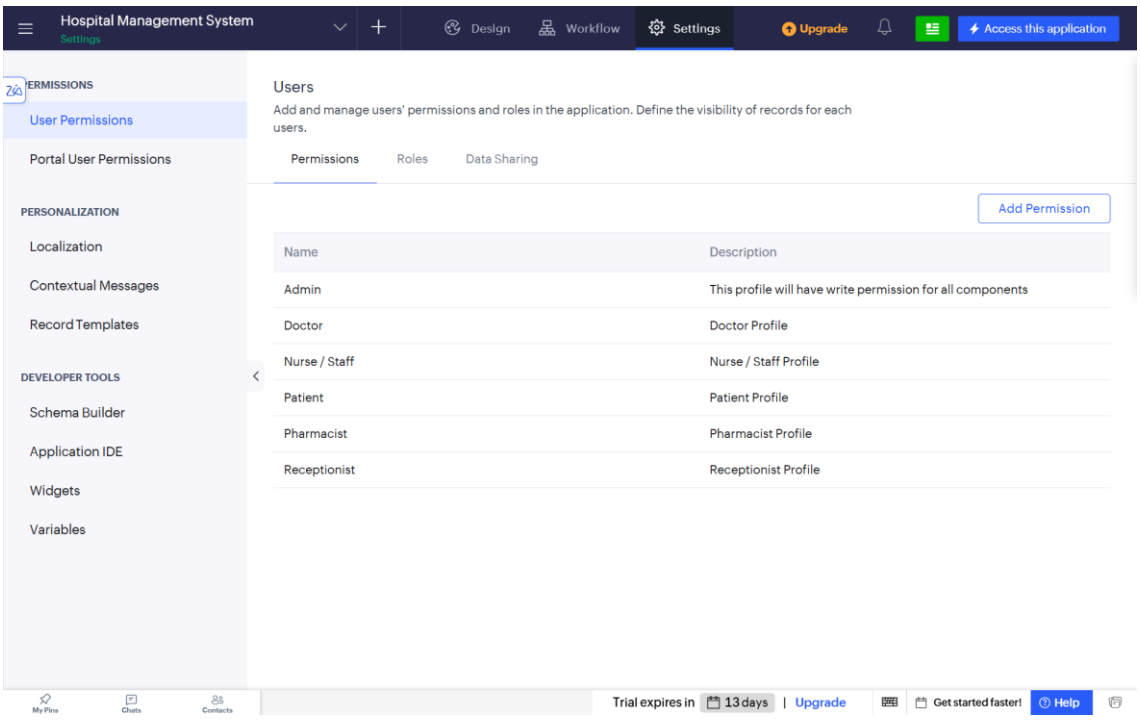

Figure 14: Permission Profiles List

15. Dashboard Summary and Visual Reports

The dashboard gives an overview of the working application through summary figures, appointment-status information, quick links and charts.

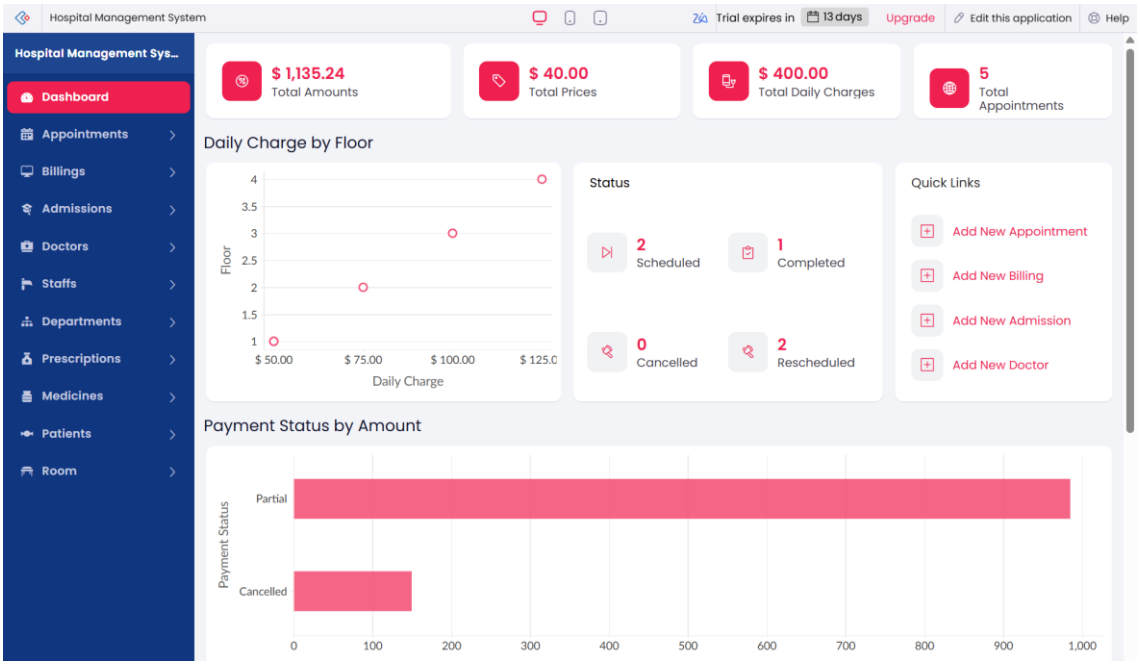

Figure 15: Dashboard Summary and Visual Reports

16. Application Dashboard and Appointment Report

The dashboard and All Appointments report provide a view of the operational application data that is managed through the role and permission configuration.

Figure 16: Application Dashboard and Appointment Report

Conclusion

The Hospital Management System practical demonstrates how roles and permission profiles can be organised in Zoho Creator. The role hierarchy separates user categories, while module-level permission settings provide a way to control access to hospital information according to each role's responsibilities.
