APPOINTMENT EMAIL NOTIFICATION AND REMINDER WORKFLOW IN ZOHO CREATOR

Objective

To configure appointment date validation, email confirmation and reminder automation in Zoho Creator for the Hospital Management System using form workflows and Deluge scripting.

Procedure

1. Open the Hospital Management System application in Zoho Creator and locate the Appointment form.
2. Create a form workflow and select the required event for appointment creation or editing.
3. Name the workflow for appointment-date validation and add the required Deluge action.
4. Set the condition to compare the selected appointment date with the current date, and display a validation message for a past date.
5. Save the validation workflow and review it in the form workflow list.
6. Create another workflow for successful appointment submission and add a Send Email action.
7. Configure the recipient, subject and confirmation message for the appointment email, then save the action.
8. Create the appointment reminder workflow, enter the Deluge script and configure its conditions.
9. Validate and save the reminder script, then review the final workflow page.

Workflow Configuration and Screenshots

The following figures are included as reference screenshots from the supplied exercise. The account details visible inside those screenshots remain as shown in the source document.

Appointment Date Validation

A form workflow is configured to check the appointment date when a record is created or edited. If the selected date is earlier than the current date, the validation action displays a message and prevents the invalid entry from being submitted.

Appointment Email Notification

An email workflow is attached to successful appointment submission. The Send Email action can notify the patient and include useful appointment information such as the scheduled date, time and status.

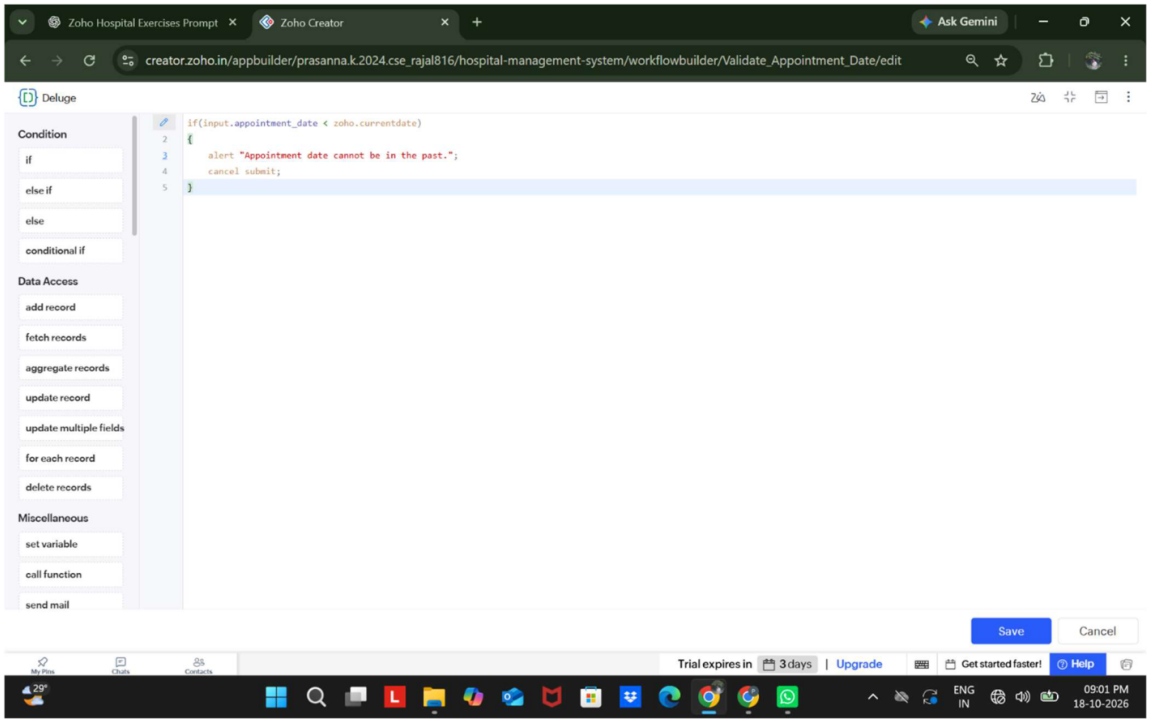

Figure 16: Setting the email recipient and subject.

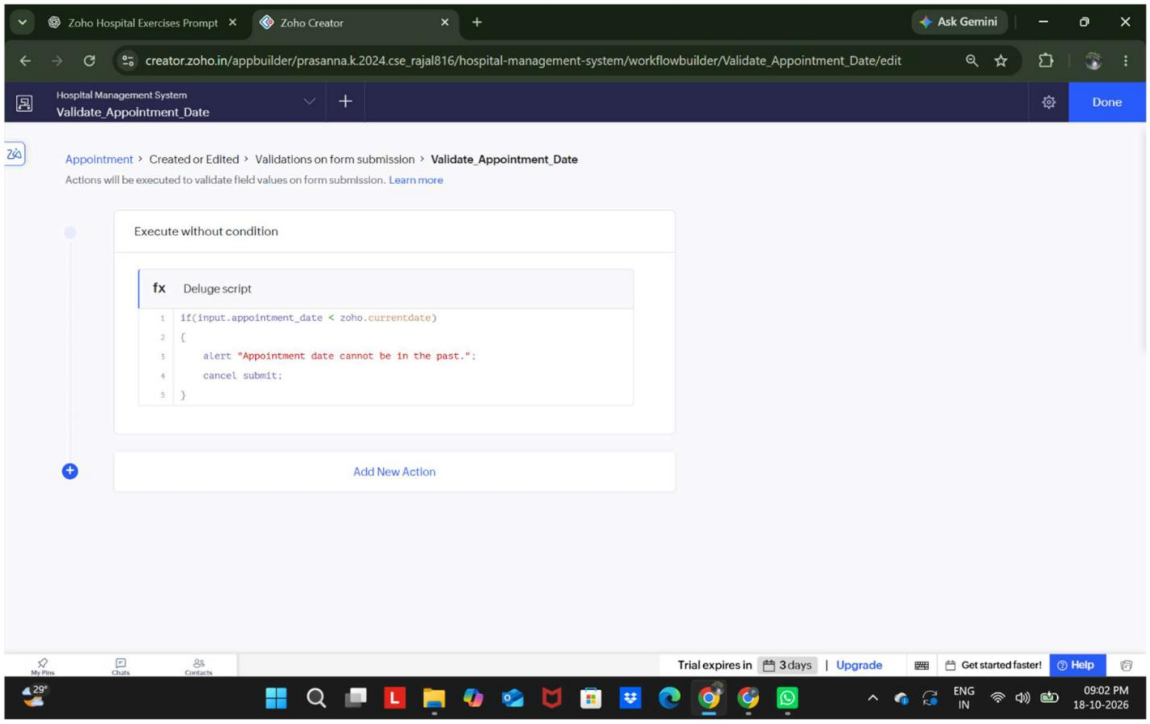

Figure 17: Entering the appointment confirmation message.

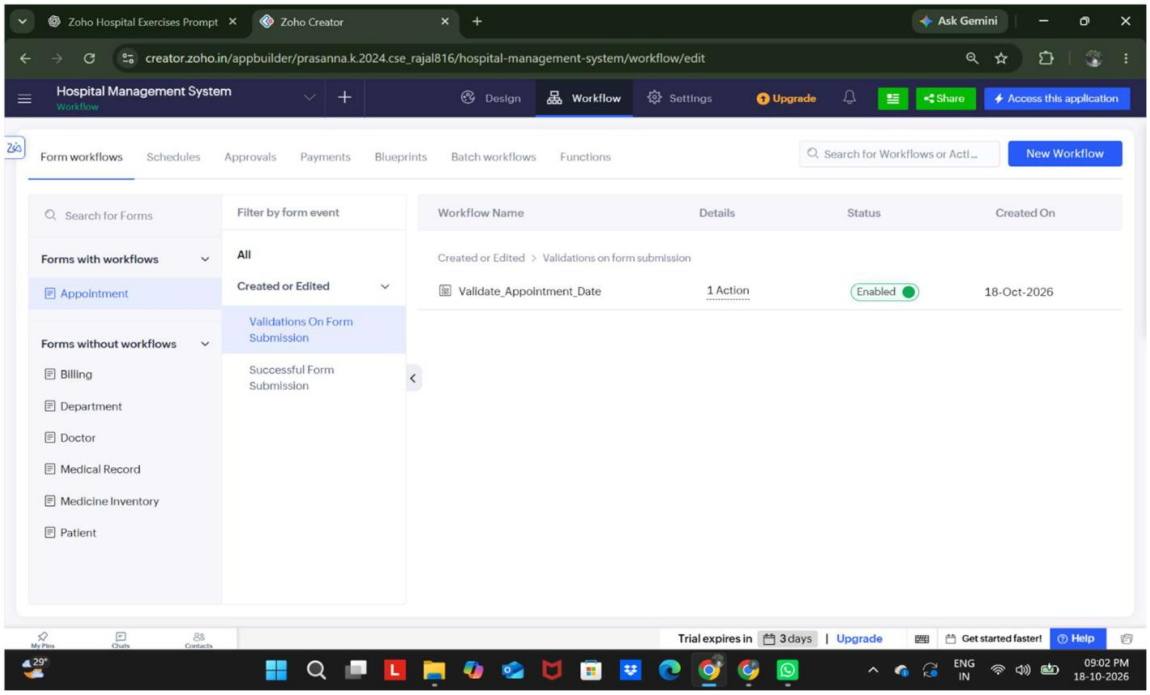

Figure 18: Saving the email notification action.

Appointment Reminder Automation

A separate reminder workflow is prepared in Deluge. Its purpose is to evaluate the configured appointment details and support automatic reminders so that patients can be informed before their scheduled visits.

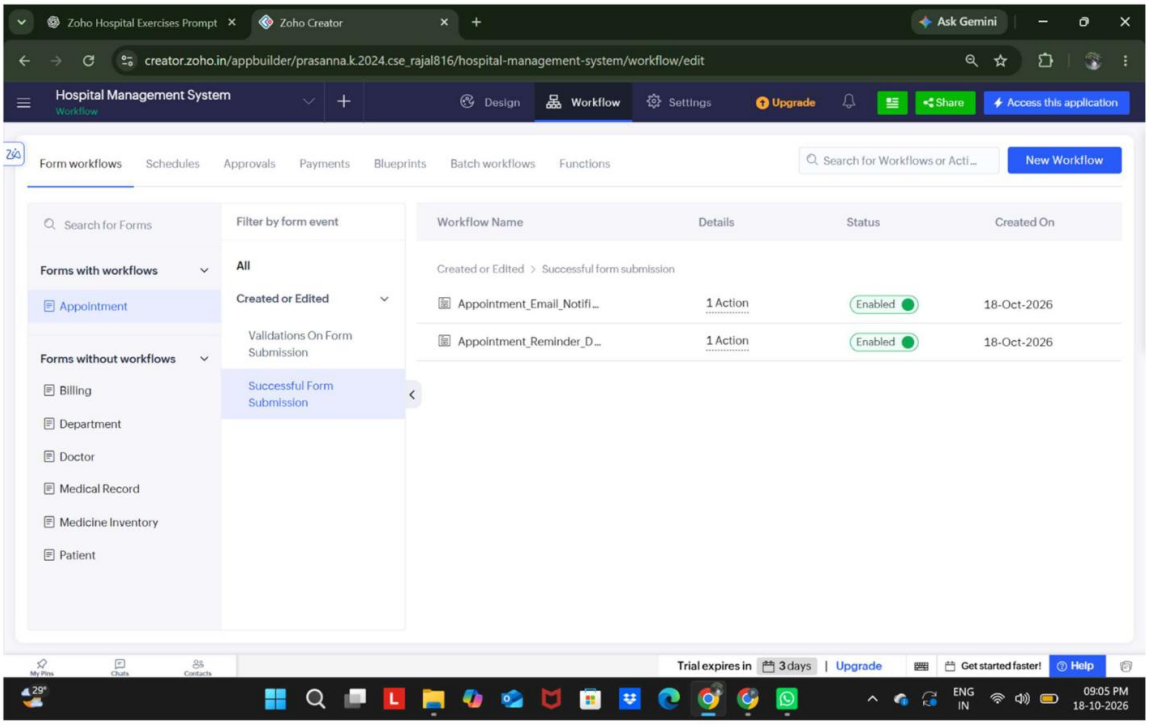

Figure 26: Reviewing the configured appointment reminder workflow.

Final Workflow Review

The workflow list is reviewed to confirm that the date-validation, appointment email and reminder configurations are present in the Hospital Management System.

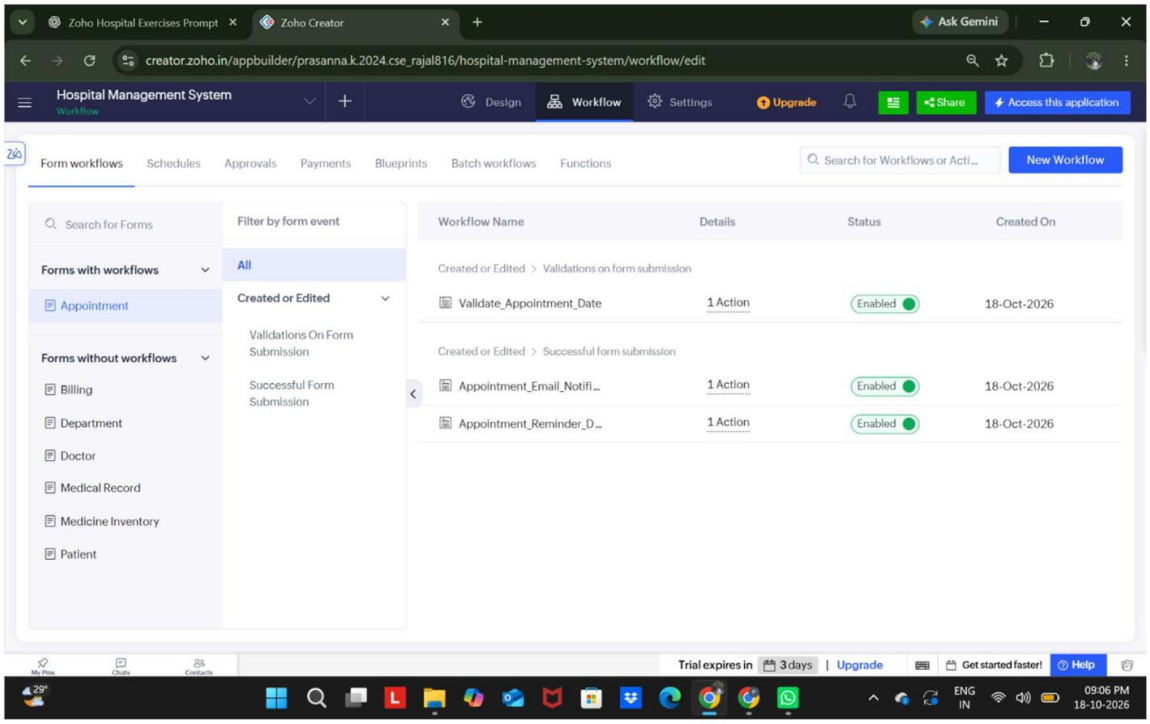

Figure 27: Final workflow page in Zoho Creator.

Result

The appointment workflows were configured in Zoho Creator to check appointment dates, send confirmation emails after successful submission and support automated reminders. The final workflow list was reviewed to verify the configured processes.
