LAB EXERCISE 09

CREATING AN APPOINTMENT STATUS BLUEPRINT IN ZOHO CREATOR

Objective

To create and configure a Blueprint in Zoho Creator for the Hospital Management System, defining appointment stages and transitions so that appointment records follow a controlled status flow from scheduling through confirmation and final outcomes.

Procedure

1. Open the Hospital Management System application in Zoho Creator and navigate to the Blueprint section.
2. Start a new Blueprint and select the Appointment form as the form on which the business process will run.
3. Enter a suitable Blueprint name and configure it to run when an appointment record is submitted.
4. Add the appointment stages shown in the practical, including Scheduled, Confirmed, Cancelled, No Show and Completed.
5. Arrange the stages on the Blueprint canvas to represent the appointment lifecycle.
6. Create transitions between the stages and name the actions Confirm Appointment, Cancel Appointment, Mark No Show and Complete Appointment.
7. Review the transition settings, save the Blueprint and enable it.
8. Check the configured Blueprint in the application.

Creating the Appointment Blueprint

The Blueprint is associated with the Appointment form and is configured to run when a record is submitted. The process name shown in the source practical is Appointment_Status_Management.

Defining Appointment Stages

The stage setup includes Scheduled, Confirmed, Cancelled, No Show and Completed. These stages represent the main states through which an appointment can move.

Arranging the Stage Flow

The stages are placed on the Blueprint canvas to show the appointment lifecycle. Scheduled is the starting stage, with paths leading to confirmation, cancellation or a no-show outcome. Completed is available as a final outcome after confirmation.

Adding and Configuring Transitions

Transitions are added between the stages to control status changes. The practical shows actions named Confirm Appointment, Cancel Appointment, Mark No Show and Complete Appointment.

Saving and Enabling the Blueprint

After the stage layout and transitions have been configured, the Blueprint is saved and enabled. The final application view displays the Appointment_Status_Management Blueprint with an enabled status.

Reference Screenshots

The following figures are reproduced from the supplied practical as reference material. The account name visible within the screenshots remains as shown in the source.

Result

The Appointment_Status_Management Blueprint was configured with appointment stages and transitions, then saved and enabled successfully.
